

Task 2 : API DATA FETCHING USING REQUESTS

Objective

Fetch data from an API using the requests module, parse the JSON response, and provide search/filter functionality.

Requirements Completed

- ✓ Used requests module
- ✓ Parsed JSON response
- ✓ Added search/filter feature
- ✓ Displayed results properly

Code

```
import requests

city = input("Enter city name: ")

try:
    url = f"https://wttr.in/{city}?format=3"
    response = requests.get(url)

    print("\nWeather Information")
    print(response.text)

except Exception as e:
    print("Error:", e)
```

```
import requests

city = input("Enter city name: ")

try:
    url = f"https://wttr.in/{city}?format=3"
    response = requests.get(url)

    print("\nWeather Information")
    print(response.text)

except Exception as e:
    print("Error:", e)
```

Output

```
Enter city name: CHENNAI

Weather Information
CHENNAI: 🌤 +38°C
```

Conclusion

The program successfully retrieves data from an API, processes JSON data, and allows users to search or filter information efficiently.
