

Task 1 : File Automation Script

Objective

Create a Python automation script that performs file operations such as renaming, sorting, or cleaning files using the OS module and exception handling.

Tools Used

Python
OS Module
Exception Handling

code

```
import os
import shutil

def organize_files(folder_path):
    try:
        if not os.path.exists(folder_path):
            print("Folder does not exist!")
            return

        files = os.listdir(folder_path)

        for file in files:
            file_path = os.path.join(folder_path, file)

            if os.path.isfile(file_path):
                extension = file.split(".")[-1].lower()

                target_folder = os.path.join(folder_path, extension.upper())

                if not os.path.exists(target_folder):
                    os.makedirs(target_folder)
```

```

        shutil.move(file_path, os.path.join(target_folder, file))

    with open("log.txt", "a") as log:
        log.write(f"Moved {file} to {extension.upper()} folder\n")

    print("Files organized successfully!")

except Exception as e:
    print("Error:", e)

folder = input("Enter folder path: ")
organize_files(folder)

import os
import shutil

def organize_files(folder_path):
    try:
        if not os.path.exists(folder_path):
            print("Folder does not exist!")
            return

        files = os.listdir(folder_path)

        for file in files:
            file_path = os.path.join(folder_path, file)

            if os.path.isfile(file_path):
                extension = file.split(".")[-1].lower()

                target_folder = os.path.join(folder_path, extension.upper())

                if not os.path.exists(target_folder):
                    os.makedirs(target_folder)

                shutil.move(file_path, os.path.join(target_folder, file))

                with open("log.txt", "a") as log:
                    log.write(f"Moved {file} to {extension.upper()} folder\n")

            print("Files organized successfully!")

    except Exception as e:
        print("Error:", e)

folder = input("Enter folder path: ")
organize_files(folder)

```

```
----- RF
Enter folder path: TestFolder
Files organized successfully!
|
```

conclusion

The script successfully automates file management operations, reduces manual effort, and records actions through logs.
